Description			
The web service should accept group details as input and create a corresponding group in Keycloak.			
<ul style="list-style-type: none">• Use Alya to create the web service.• Use gocloak to create a group in Keycloak based on the input group details.• This web service will create a new group attribute with name capabilities with value empty JSON {}• It will also create a mapper to map this capabilities attribute with a field in claims called [groupName]Capabilities e.g. if the group name is accounts the mapper name will be accountsCaps and the field in the claims will be accountsCaps.• Handle any errors that may occur during the group creation process and returning the error response.• Test the web service to ensure it creates group correctly in Keycloak.
